• Encryption Technology
• Software Licences, Software Development and Customisation
• Hardware Purchases and Implementation
• Technical Maintenance and Support
• Data Protection and PrivacyOur highly-recognised information technology (“IT”) practice has been built on a prolonged duration of intensive engagement with IT industry trends and developments - before, throughout and post the first burgeoning of the Internet and the challenges and opportunities to business that it has posed.

Our signature has been our serial involvement with projects that have been the first of its kind in its day such as substantial IT outsourcing by regulated enterprises, digital distribution of sound and multimedia data, electronic tracking of digital data consumption, electronic management of documents and inventory control, supply-and-demand online exchanges, virtual private networks with points-of-presence across jurisdictions and cashless payment systems, just to name a few.

We advise on the regulatory aspects of IT usage, such as in relation to Internet content and service providers, computer misuse, data protection, electronic records and transacting through electronic means.
